

THE NATIONAL ARMS  
TRANSFER DATABASE  
(NATD)

The NATD is a low-cost, easy-to-use software package designed for low-capacity states. Its aim is to prevent the diversion of arms, to control arms transfers and to maintain accurate records of conventional weapons. This simple software also helps generate departmental and national reports at the press of a button.

Every installation is custom-built to the needs of each government agency. The software runs on a Windows desktop or a laptop, and is by far the most affordable solution available. Developed in Papua New Guinea, the NATD is soon to be installed in Samoa and Fiji.

THE INEXPENSIVE ARMS  
MANAGEMENT SYSTEM TAILOR-MADE  
FOR EACH INDIVIDUAL SMALL AND  
DEVELOPING STATE

### Individual Design to Suit Each State

Once the NATD is delivered, user permissions and any networking or online access are controlled solely by the client. This modular software allows a government to specify its own design to fit existing systems and to meet national and international responsibilities, including reporting.

The core record-keeping functionality can be configured to match an existing national control system. A state can specify its own definition of "international transfers", then choose an arms control list to suit its region and its needs. If the laws of a country permit civilian gun ownership, additional NATD features can be switched on to keep records of corporate security sector or private firearms and any associated documentation or photographic licences.

NATD is modular, allowing users to configure systems to match existing national frameworks and practices.

### Affordable Solution for Small and Developing States

By improving the accuracy, security and permanence of state records, the NATD is specifically designed to prevent diversion and illicit trafficking of conventional arms among small to medium states with limited capacity. To explore opportunities for development assistance, please Contact the Centre for Armed Violence Reduction.

### Identification and Tracing Tools

Where an unknown conventional arm is located or seized and enters the database in state custody, the software can link to internationally recognised arms identification libraries. These include tens of thousands of conventional arms, along with detailed descriptors, the format and location of serial numbers, country and manufacturer markings, model details and reference photographs. This creates accurate records for international tracing requests and describes seized firearms awaiting judicial process, destruction or other disposal.

### Reporting Made Easy

A wide range of reports can be displayed, printed and exported, combining data fields into customised outputs of most use to the state. Even if separate software installations are customised for independent state agencies – for example military, law enforcement, corrections and civilian databases – each system will export reports in the same format, using the same list of descriptors. Without sharing confidential databases, separate agencies can deliver identical outputs, easily combined into a single national report to meet the requirements of international agreements.

The NATD is easily sorted and searched.

The NATD is designed to comply with the provisions of the Arms Trade Treaty, its data fields are sortable and searchable, and each form can display as many (or as few) columns of data as required by the national system. Each state can choose its own language to be displayed onscreen.

Reports can easily be generated to meet the requirements of each user state, as well as international treaties and obligations.
